

#### AccountRegistration:

- Implement Password and Email Requirements Similar to that Of ProfileEditor
- Maybe add strings for when password or email doesn't match requirements

#### FailedLogin:

- Code doesn't loop five times to let the user actually input something instead it exists after a single attempt.

```
/Users/main/Library/Java/JavaVirtualMachines/openjdk-23.0.2/Contents/Home/bin/java -javaagent:/Applications/IntelliJ IDEA 2.app/Contents/lib/idea_rt.jar=6088
Username: yes
Password: no
Invalid credentials. 4 attempt(s) left.
Process finished with exit code 0
```

#### MultiFactor Authentication:

- For now it's alright but later on, we shall remove the part where it asks for the user's username first.

#### Profile Editor:

- For now it's alright but later on, we will need to remove the part where it asks for a username.
- Need calling of three new options. 1)enableMFA() 2)deleteAccount() 3)Logout
- Shouldn't call for MFA for every single time you want to make a change to your username. Instead, it should only call when you are enabling it, disabling it.

#### ResetCredentials:

- Looks alright, nothing to change.(It's different from profileEditor since you don't have to be logged in when you do this)

#### User:

- This is just a placeholder for when other teams might want something.

#### UserLogin:

- Implement FailedLogin & MFA authentication for certain accounts.(it tends to loop to infinity)
- Implement Guest Login usernames.

#### UserLogout:

- All good.

#### Delete Account(method):

- Should remove account from database first
- Should force Logout by calling UserLogout and removing them from active sessions file.
